Absorption Spectra in the Ultraviolet and Visible Regions

Edited by **L. Láng**

"On the basis of its coverage, this collection is indeed an important contribution to this branch of spectroscopy."

—PHYSICS TODAY

This series presents an immense quantity of new data as well as some previously published material which has been further supplemented. It covers both organic and inorganic complex compounds together with single- and multi-cyclic aromatic systems, hetero-aromatic compounds, and Si-organic compounds. Each volume presents a large number of spectra of basic pharmaceutical materials or of active agents. Volume 11 contains spectra and numerical spectral data for some 200 compounds, bringing the total number of compounds covered in this monumental collection to more than 2000.
